Asymptotic Notations

Figure 3.1 Graphic examples of the Θ , O , and Ω notations. In each part, the value of n_0 shown is the minimum possible value; any greater value would also work. **(a)** Θ -notation bounds a function to within constant factors. We write $f(n) = \Theta(g(n))$ if there exist positive constants n_0 , c_1 , and c_2 such that at and to the right of n_0 , the value of $f(n)$ always lies between $c_1g(n)$ and $c_2g(n)$ inclusive. **(b)** O -notation gives an upper bound for a function to within a constant factor. We write $f(n) = O(g(n))$ if there are positive constants n_0 and c such that at and to the right of n_0 , the value of $f(n)$ always lies on or below $cg(n)$. **(c)** Ω -notation gives a lower bound for a function to within a constant factor. We write $f(n) = \Omega(g(n))$ if there are positive constants n_0 and c such that at and to the right of n_0 , the value of $f(n)$ always lies on or above $cg(n)$.

■ Summations

$$\text{Let } s = a + ar + ar^2 + ar^3 + \cdots + ar^{n-1}.$$

$$\text{Then } rs = ar + ar^2 + ar^3 + ar^4 + \cdots + ar^n$$

$$\text{Then } s - rs = a - ar^n$$

$$\text{Then } s(1 - r) = a(1 - r^n), \text{ so } s = a \frac{1 - r^n}{1 - r} \quad (\text{if } r \neq 1).$$

Sums of Powers of Natural Numbers

$$1. \quad 1 + 2 + 3 + \cdots + n = \sum_{i=1}^n i = \frac{n(n+1)}{2}$$

$$2. \quad 1^2 + 2^2 + 3^2 + \cdots + n^2 = \sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}$$

$$3. \quad 1^3 + 2^3 + 3^3 + \cdots + n^3 = \sum_{i=1}^n i^3 = \frac{n^2(n+1)^2}{4}$$
