

Assignment for Lecture 10

1. Develop the Complex class as the following specification in C++ and Java:

```
#ifndef COMPLEX_H
#define COMPLEX_H

class Complex {
private:
    double real;
    double imag;
public:
    Complex(double real = 0.0, double imag = 0.0);
    double getReal() const;
    void setReal(double real);
    double getImag() const;
    void setImag(double imag);
    void setValue(double real, double imag);
    void print() const;
    bool isReal() const;
    bool isImaginary() const;
    // Add the given Complex instance into this instance, and return this instance by reference
    Complex & addInto(const Complex & another);
    Complex & addInto(double real, double imag);
    // Add the given Complex instance and this instance, return the sum in a new instance by value
    Complex addReturnNew(const Complex & another) const;
    Complex addReturnNew(double real, double imag) const;
};

#endif
```

2. Implement the class Date in C++ (Date.h, Date.cpp)/Java
