## Chapter 2 Atoms, Molecules, and Ions

# Contents

- 2-1 The Atomic Theory of Matter
- 2-2 The Discovery of Atomic Structure
- 2-3 The Modern View of Atomic Structure
- 2-4 Atomic Weights
- 2-5 The Periodic Table
- 2-6 Molecules and Molecular Compounds
- 2-7 Ions and Ionic Compounds
- 2-8 Naming Inorganic Compounds
- Self reading: 2-9 Some simple Organic Compounds

## 2-1 The Atomic Theory of Matter

**Aristotle**

**(384 – 322 B.C.)**

Four primary qualities of matter: hotness, coldness, wetness, and dryness

Their combinations appear as: **fire** (hot and dry), **earth** (dry and cold), **water** (cold and wet) and **air** (wet and hot)

**Democritus**  
**(460 – 370 B.C.)**

Atomos

- physically, but not geometrically, indivisible;
- indestructible;
- always in motion;
- there lies empty space between atoms;
- there is an infinite number of atoms and of kinds of atoms, which differ in shape and size;
- the more any indivisible exceeds, the heavier it is

**John Dalton**  
(1766 – 1844)

- Each element is composed of small particles called **atoms**.
- All atoms of a given element are **identical**.

- Atoms are **neither created nor destroyed nor changed from one type to another** in chemical reactions,

- **Compounds** are formed when atoms of **more than one element** combine.

- Conservation of mass
- Constant composition

# Consequences of Dalton's theory

- ◆ **Law of Definite Proportions:** combinations of elements are in ratios of small whole numbers.

☆ In forming carbon monoxide, 1.33 g of oxygen combines with 1.0 g of carbon.

☆ In the formation of hydrogen peroxide 2.66 g of oxygen combines with 1.0 g of hydrogen.

## 2-2 Discovery in Atomic Structure

**Thomson**  
**electrons 1897**

**Rutherford**  
**protons 1919**

**James Chadwick**  
**neutrons 1932**

# Cathode rays and Electrons

# Properties of cathode rays & Discovery of electron

(a)

deflected by an electric field

(b)

deflected by a magnetic field

(c)

Thomson's charge-to-mass ratio  $e/m = 1.76 \times 10^8$  coulombs/g

# Charge on the electron

Would the masses of the oil drops be changed significantly by any electrons that accumulate on them?

- ★ The ionized oil drops can be balanced against the pull of gravity by an electric field.
- ★ The charge is an *integral* multiple of the electronic charge,  $1.602 \times 10^{-19} \text{ C}$ .

# Mass of the electron

$$\text{Electron mass} = \frac{1.602 \times 10^{-19} \text{ C}}{1.76 \times 10^8 \text{ C/g}} = 9.10 \times 10^{-28} \text{ g}$$

# Radioactivity

**Radioactivity is the spontaneous emission of radiation from a substance.**

- X-rays and  $\gamma$ -rays are high-energy light.
- $\alpha$ -particles are a stream of helium nuclei,  $\text{He}^{2+}$ .
- $\beta$ -particles are a stream of high speed electrons that originate in the nucleus.

# Geiger and Rutherford 1909

Most of the mass and all of the positive charge is concentrated in a small region called the nucleus .

There are as many electrons outside the nucleus as there are units of positive charge on the nucleus

**Rutherford  
protons 1919**

**James Chadwick  
neutrons 1932**

## Marble Model

Dalton (1803)

## Plum Pudding Model

Thomson (1904)  
(positive and negative charges)

## The Nuclear Model

Rutherford (1911)  
(the nucleus)

## The Planetary Model

Bohr (1913)  
(energy levels)

Schrödinger (1926)  
(electron cloud model)

**When people still think  
that atoms look like this**

**instead of this**

©2001 How Stuff Works

**"You disappoint me."**

**Werner Heisenberg  
(1901-1976)**

## 2-3 The Modern View of Atomic Structure

**Every atom has an equal number of electrons and protons, so atoms have no net electrical charge.**

# Chemical Elements

**\*To represent a particular atom we use symbolism:**

A = mass number

Z = atomic number

# Atomic Number & Mass Number

Symbol of carbon

**Mass number**  
(# of protons plus neutrons)

**Atomic number**  
(# of protons)

The **atomic number (Z) is always the same** for all atoms with same letter symbol

The **mass number (A) can change** for different atoms with the same letter symbol

# Isotopes

**Isotopes** are atoms with the same **atomic number** but different atomic masses. This happens when two otherwise identical atoms have different numbers of **neutrons**.

Carbon twelve

6 protons + 6 neutrons

Carbon thirteen

6 protons + 7 neutrons

Carbon fourteen

6 protons + 8 neutrons

## 2-4 Atomic Weights

**\*The heaviest atom has a mass of only  $4.8 \times 10^{-22}$  g and a diameter of only  $5 \times 10^{-10}$  m.**

### **Useful units:**

☆ **1 amu (atomic mass unit) =  $1.66054 \times 10^{-27}$  kg**

☆ **1 pm (picometer) =  $1 \times 10^{-12}$  m**

☆ **1 Å (Angstrom) =  $1 \times 10^{-10}$  m = 100 pm =  $1 \times 10^{-8}$  cm**

Biggest atom is 240 amu and is 50 Å across.

Typical C-C bond length 154 pm (1.54 Å)

Molecular models are 1 Å /inch or about 0.4 Å /cm

## Atomic mass unit (amu)

one twelfth of the mass of an unbound neutral atom of carbon 12 in its nuclear and electronic ground state and at rest, and has a value of  $1.660539040(20) \times 10^{-27}$  kg,

| Particle | Mass                     |            | Electric Charge           |              |
|----------|--------------------------|------------|---------------------------|--------------|
|          | kg                       | amu        | Coulombs                  | ( <i>e</i> ) |
| Electron | $9.1094 \times 10^{-31}$ | 0.00054858 | $-1.6022 \times 10^{-19}$ | -1           |
| Proton   | $1.6726 \times 10^{-27}$ | 1.0073     | $+1.6022 \times 10^{-19}$ | +1           |
| Neutron  | $1.6749 \times 10^{-27}$ | 1.0087     | 0                         | 0            |

# Atomic Weight vs Atomic Mass

- Most of carbon atoms have just 6 protons and 6 neutrons

$$\text{Atomic mass of } ^{12}\text{C} = 6+6 = 12$$

- Some carbon atoms have 6 protons and 7 neutrons

$$\text{Atomic mass of } ^{13}\text{C} = 6+7 = 13$$

- Even fewer number of carbon atoms have 6 protons and 8 neutrons

$$\text{Atomic mass of } ^{14}\text{C} = 6+8 = 14$$

**Which one is most representative?**

$$\text{Atomic weight} = \sum_{\substack{\text{over all} \\ \text{isotopes of} \\ \text{the element}}} [(\text{isotope mass}) \times (\text{fractional isotope abundance})]$$

# Fractional Isotope Abundance

## EXAMPLE

Naturally occurring carbon is composed of 98.93%  $^{12}\text{C}$  and 1.07%  $^{13}\text{C}$ .

The atomic mass of  $^{12}\text{C}$  is (exactly) 12 u, and

the atomic mass of  $^{13}\text{C}$  is 13.00335 u,

making the atomic weight of carbon:

$$\left(\frac{98.93}{100}\right)12u + \left(\frac{1.07}{100}\right)13.00335u = 12.01u$$

**The sum of the percent natural abundances must be 100%.**

## EXAMPLE

Naturally occurring chlorine is 75.78%  $^{35}\text{Cl}$  (atomic mass 34.969 u) and 24.22%  $^{37}\text{Cl}$  (atomic mass 36.966 u). Calculate the atomic weight of chlorine.

$$\begin{aligned}\text{Atomic weight} &= (0.7578)(34.969 \text{ u}) + (0.2422)(36.966 \text{ u}) \\ &= 26.50 \text{ u} + 8.953 \text{ u} \\ &= 35.45 \text{ u}\end{aligned}$$

## EXAMPLE

### **Relating the Masses and Natural Abundances of Isotopes to the Atomic Mass of an Element.**

Bromine has two naturally occurring isotopes, bromine-79 and bromine-81. Bromine-79 has a mass of 78.9183 u and an abundance of 50.69%. Use the atomic weight of bromine found in the periodic table to determine the mass and percent of natural abundance of bromine-81?

# EXAMPLE

## **Solution**

Write the general equations

$$100\% = \chi_1 + \chi_2 + \chi_3 \dots$$

$$\text{Atomic mass} = \chi_1 \times m_1 + \chi_2 \times m_2 + \chi_3 \times m_3 \dots$$

# EXAMPLE

**Identify the knowns and unknowns in the specific equations**

$$\text{Atomic mass} = \chi_{\text{Br-79}} \times m_{\text{Br-79}} + \chi_{\text{Br-81}} \times m_{\text{Br-81}}$$

**Solve**

$$100\% = \chi_{79} + \chi_{81}$$

$$\chi_{81} = 100\% - \chi_{79}$$

$$m_{\text{Br-81}} = \frac{\text{Atomic mass} - (\chi_{\text{Br-79}} \times m_{\text{Br-79}})}{\chi_{\text{Br-81}}}$$

**Calculate**

$$m_{\text{Br-81}} = \frac{79.904 \text{ u} - (0.5069 \times 78.9183 \text{ u})}{0.4931} = 80.92 \text{ u}$$

## 2-5 The Periodic Table

- Read atomic masses.
- Read the ions formed by main group elements.
- Read the electron configuration.
- Learn trends in physical and chemical properties.

## EXAMPLE

*1. Which two of these elements would you expect to show the greatest similarity in chemical and physical properties: B, Ca, F, He, Mg, P?*

Your answer: \_\_\_\_\_

*2. A biochemist who is studying the properties of certain sulfur (S)–containing compounds in the body wonders whether trace amounts of another nonmetallic element might have similar behavior. To which element should she turn her attention?*

- (a) O,
- (b) As,
- (c) Se,
- (d) Cr,
- (e) P

**YOU CAN'T TRUST ATOMS**

**THEY MAKE UP EVERYTHING**

imgflip.com

## 2-6 Molecules and Molecular Compounds

- Only the noble-gas elements are normally found in nature as isolated atoms.
- Most matter is composed of molecules or ions.

### *Diatomic molecules*

Hydrogen, H<sub>2</sub>

Oxygen, O<sub>2</sub>

### *Molecular compounds*

Water, H<sub>2</sub>O

Methane, CH<sub>4</sub>

Carbon  
monoxide, CO

Ethylene, C<sub>2</sub>H<sub>4</sub>

***Molecular compounds are generally composed of nonmetals only***

# Molecular and Empirical Formulas

- Chemical formulas that indicate the **actual numbers of atoms** in a molecule are called **molecular formulas**
- Chemical formulas that give only the **relative number of atoms of each type** in a molecule are called **empirical formulas**

Example:

|                   | Hydrogen peroxide      | Ethylene               |
|-------------------|------------------------|------------------------|
| Molecular formula | $\text{H}_2\text{O}_2$ | $\text{C}_2\text{H}_4$ |
| Empirical formula | $\text{HO}$            | $\text{CH}_2$          |

- For many substances, the molecular formula and the empirical formula are identical, as in the case of water,  $\text{H}_2\text{O}$

## EXAMPLE

Write the empirical formulas for

- (a) glucose, a substance also known as either blood sugar or dextrose—molecular, whose molecular formula is  $\text{C}_6\text{H}_{12}\text{O}_6$ ;
- (b) nitrous oxide, a substance used as an anesthetic and commonly called laughing gas—molecular, whose molecular formula is  $\text{N}_2\text{O}$
- (c) decaborane, whose molecular formula is  $\text{B}_{10}\text{H}_{14}$

## PRACTICE 1

Tetracarbon dioxide is an unstable oxide of carbon with the following molecular structure:

What are the molecular and empirical formulas of this substance?

- (a)  $C_2O_2$ ,  $CO_2$ ,
- (b)  $C_4O$ ,  $CO$ ,
- (c)  $CO_2$ ,  $CO_2$ ,
- (d)  $C_4O_2$ ,  $C_2O$ ,
- (e)  $C_2O$ ,  $CO_2$ .

# Picturing Molecules

- A **symbol-and-line formula** usually does not show the actual angles between atoms
- A **perspective drawing** shows the three-dimensional shape
- A **ball-and-stick model** represents the angles between atoms
- A **space-filling model** show the relative sizes of the atoms, but the angles between atoms

## 2-7 Ions and Ionic Compounds

# How do ions form?

- A **positive** charge ion is a **cation** (pronounced CAT-ion);
- A **negatively** charged ion is an **anion** (AN-ion)

## EXAMPLE

Give the chemical symbol, including superscript indicating mass number, for

(a) the ion with 22 protons, 26 neutrons, and 19 electrons;

(b) the ion of sulfur that has 16 neutrons and 18 electrons.

## EXAMPLE

*1. In which of the following species is the number of protons less than the number of electrons?*

(a)  $\text{Ti}^{2+}$ ,

(b)  $\text{P}^{3-}$ ,

(c)  $\text{Mn}$ ,

(d)  $\text{Se}_4^{2-}$

(e)  $\text{Ce}^{4+}$ .

Your answer: \_\_\_\_\_

*2. How many protons, neutrons, and electrons does the  $^{79}\text{Se}^{2-}$  ion possess?*

Your answer: \_\_\_\_\_ protons, \_\_\_\_\_ neutrons, \_\_\_\_\_ electrons

# Predicting Ionic Charges

- The noble gases are chemically nonreactive elements that form very few compounds.
- Many atoms gain or lose electrons to end up with **the same number of electrons as the noble gas closest to them** in the periodic table.

- The red stepped line that divides metals from nonmetals also separates cations from anions.*
- Hydrogen forms both 1+ and 1- ions.*

## EXAMPLE

*1. Predict the charge expected for the most stable ion of*

*(a) barium*

*(b) Oxygen*

*(c) Aluminum*

*(d) fluorine.*

## EXAMPLE

3. *Use the periodic table to determine which of the following ions has a noble–gas electron arrangement, and which do not. For those that do, indicate the noble–gas arrangement they match:*

# Ionic Compounds

- A great deal of chemical activity involves the transfer of electrons from one substance to another

***Ionic compounds are generally combinations of metals and nonmetals***

## EXAMPLE

1. Which of these compounds would you expect to be ionic:  $N_2O$ ,  $Na_2O$ ,  $CaCl_2$ ,  $SF_4$ ?

Your answer: \_\_\_\_\_

2. Which of these compounds are molecular:  $CBr_4$ ,  $FeS$ ,  $P_4O_6$ ,  $PbF_2$

Your answer: \_\_\_\_\_

## EXAMPLE

Give a reason why each of the following statements is a safe prediction:

- (a) *Every compound of Rb with a nonmetal is ionic in character.*
- (b) *Every compound of nitrogen with a halogen element is a molecular compound.*
- (c) *The compound  $\text{MgKr}_2$  does not exist.*
- (d) *Na and K are very similar in the compounds they form with nonmetals.*
- (e) *If contained in an ionic compound, calcium (Ca) will be in the form of the doubly charged ion,  $\text{Ca}^{2+}$ .*

## EXAMPLE

Write the empirical formula of the compound formed by

(a)  $\text{Al}^{3+}$  and  $\text{Cl}^-$  ions,

(b)  $\text{Al}^{3+}$  and  $\text{O}^{2-}$  ions,

(c)  $\text{Mg}^{2+}$  and  $\text{NO}_3^-$  ions.

## 2-8 Naming Inorganic Compounds

*Different ions of the same element have different properties*

# Naming Cation

a. Cations formed from metal atoms have the same name as the metal:

---

$\text{Na}^+$  sodium ion

$\text{Zn}^{2+}$  zinc ion

$\text{Al}^{3+}$  aluminum ion

---

b. If a metal can form cations with different charges, the positive charge is indicated by a Roman numeral in parentheses following the name of the metal:

$\text{Fe}^{2+}$  iron(II) ion (ferrous ion)

$\text{Cu}^+$  copper(I) ion (cuprous ion)

$\text{Fe}^{3+}$  iron(III) ion (ferric ion)

$\text{Cu}^{2+}$  copper(II) ion (cupric ion)

---

c. Cations formed from nonmetal atoms have names that end in **-ium**:

---

$\text{NH}_4^+$  ammonium ion

$\text{H}_3\text{O}^+$  hydronium ion

---

# Naming Anion

- a. The names of monatomic anions are formed by replacing the ending of the name of the element with ***-ide***

---

$\text{H}^-$  hydride ion

$\text{O}^{2-}$  oxide ion

$\text{N}^{3-}$  nitride ion

---

A few polyatomic anions also have names ending in ***-ide***

---

$\text{OH}^-$  hydroxide ion

$\text{CN}^-$  cyanide ion

$\text{O}_2^{2-}$  peroxide ion

---

## Naming Anion (*cont.*)

b. Polyatomic anions containing oxygen are called **oxyanions**,  
subfixes

**-ate** for the most common or representative oxyanion of an element

**-ite** for an oxyanion that has the same charge but one O atom fewer

|                 |             |                    |             |
|-----------------|-------------|--------------------|-------------|
| $\text{NO}_3^-$ | nitrate ion | $\text{SO}_4^{2-}$ | sulfate ion |
| $\text{NO}_2^-$ | nitrite ion | $\text{SO}_3^{2-}$ | sulfite ion |

prefixes

**per-** indicates one more O atom than the oxyanion ending in **-ate**

**hypo-** indicates one O atom fewer than the oxyanion ending in **-ite**

|                  |                                                   |
|------------------|---------------------------------------------------|
| $\text{ClO}_4^-$ | perchlorate ion (one more O atom than chlorate)   |
| $\text{ClO}_3^-$ | chlorate ion                                      |
| $\text{ClO}_2^-$ | chlorite ion (one O atom fewer than chlorate)     |
| $\text{ClO}^-$   | hypochlorite ion (one O atom fewer than chlorite) |

# Naming Ionic Compounds

Names of ionic compounds consist of the cation name followed by the anion name

calcium chloride

aluminum nitrate

copper(II) perchlorate (or cupric perchlorate)

# EXAMPLE

*Name the ionic compounds*

## EXAMPLE

*Which of the following ionic compounds is **incorrectly** named?*

- (a)  $\text{Zn}(\text{NO}_3)_2$ , zinc nitrate;
- (b)  $\text{TeCl}_4$ , tellurium(IV) chloride;
- (c)  $\text{Fe}_2\text{O}_3$ , diiron oxide;
- (d)  $\text{BaO}$ , barium oxide;
- (e)  $\text{Mn}_3(\text{PO}_4)_2$ , manganese (II) phosphate.

# EXAMPLE

*Name the ionic compounds*

# Names and Formulas of Acids

1. Acids containing anions whose names end in **-ide** are named by changing the **-ide** ending to **-ic**, adding the prefix **hydro-** to this anion name, and then following with the word acid:

| Anion                     | Corresponding Acid                        |
|---------------------------|-------------------------------------------|
| $\text{Cl}^-$ (chloride)  | $\text{HCl}$ (hydrochloric acid)          |
| $\text{S}^{2-}$ (sulfide) | $\text{H}_2\text{S}$ (hydrosulfuric acid) |

2. Acids containing anions whose names end in **-ate** or **-ite** are named by changing **-ate** to **-ic** and **-ite** to **-ous** and then adding the word acid. Prefixes in the anion name are retained in the name of the acid:

| Anion                          | Corresponding Acid                |
|--------------------------------|-----------------------------------|
| $\text{ClO}_4^-$ (perchlorate) | $\text{HClO}_4$ (perchloric acid) |
| $\text{ClO}_3^-$ (chlorate)    | $\text{HClO}_3$ (chloric acid)    |
| $\text{ClO}_2^-$ (chlorite)    | $\text{HClO}_2$ (chlorous acid)   |
| $\text{ClO}^-$ (hypochlorite)  | $\text{HClO}$ (hypochlorous acid) |

## Anion

\_\_\_\_ide  
(chloride,  $\text{Cl}^-$ )

add  $\text{H}^+$   
ions

## Acid

hydro\_\_\_\_ic acid  
(hydrochloric acid,  $\text{HCl}$ )

\_\_\_\_ate  
(chlorate,  $\text{ClO}_3^-$ )  
(perchlorate,  $\text{ClO}_4^-$ )

add  $\text{H}^+$   
ions

\_\_\_\_ic acid  
(chloric acid,  $\text{HClO}_3$ )  
(perchloric acid,  $\text{HClO}_4$ )

\_\_\_\_ite  
(chlorite,  $\text{ClO}_2^-$ )  
(hypochlorite,  $\text{ClO}^-$ )

add  $\text{H}^+$   
ions

\_\_\_\_ous acid  
(chlorous acid,  $\text{HClO}_2$ )  
(hypochlorous acid,  $\text{HClO}$ )

# EXAMPLE

1. *Name the acids*

(a) HCN,

(b) HNO<sub>3</sub>,

(c) H<sub>2</sub>SO<sub>4</sub>,

(d) H<sub>2</sub>SO<sub>3</sub>.

## EXAMPLE

*Which of the following acids are **incorrectly** named? For those that are, provide a correct name or formula.*

(a) hydrocyanic acid, HCN;

(b) nitrous acid,  $\text{HNO}_3$ ;

(c) perbromic acid,  $\text{HBrO}_4$ ;

(d) iodic acid, HI;

(e) selenic acid,  $\text{HSeO}_4$ .

# Names and Formulas of Binary Molecular Compounds

- 1. The name of the element farther to the left in the periodic table (closest to the metals) is usually written first.*** An exception occurs when the compound contains oxygen and chlorine, bromine, or iodine (any halogen except fluorine), in which case oxygen is written last.
- 2. If both elements are in the same group, the one closer to the bottom of the table is named first.***
- 3. The name of the second element is given an -ide ending.***
- 4. Greek prefixes indicate the number of atoms of each element.***

$\text{Cl}_2\text{O}$     dichlorine monoxide

$\text{NF}_3$     nitrogen trifluoride

$\text{N}_2\text{O}_4$     dinitrogen tetroxide

$\text{P}_4\text{S}_{10}$     tetraphosphorus decasulfide

# EXAMPLE

Name the compounds

(a)  $\text{SO}_2$ ,

(b)  $\text{PCl}_5$ ,

(c)  $\text{Cl}_2\text{O}_3$ ,

(d)  $\text{CS}_2$ ,

(e)  $\text{CO}$ ,

(f)  $\text{C}_3\text{O}_2$ ,

(g)  $\text{CBr}_4$ ,

(h)  $\text{CF}$

## EXAMPLE

Give the chemical formulas for

(a) silicon tetrabromide,

(b) disulfur dichloride,

(c) diphosphorus hexaoxide.
