

Welcome to Week 11

Dear students,

Time flies — it is already Week 11! We have now covered most of the Python programming materials for this course. This week, I have posted a class module on 2D plotting so you can learn how to create graphics and visualizations in Python.

You will need to install matplotlib using pip (similar to how we installed numpy in the Week 1 module). I think this is a fun topic, and I simply want you to enjoy exploring it. There will be no assignments this week!

As you already know, I will arrive at HUST in Hanoi next week and begin our face-to-face lectures on 5/18. We will start by reviewing Python programming and combining many of the topics we have learned throughout the semester. After the review, probably on 5/20 or 21, we will have a pen-and-paper coding test, so please do not rely too heavily on AI for developing your programming skills.

I am really looking forward to meeting all of you in person. See you soon!

Dr. Chen
