Acoustics is the study of sound.

- Physical - sound as a disturbance in the air
- Psychophysical - sound as perceived by the ear
- Sound as stimulus (physical event) & sound as a sensation.
- Pressures changes (in band from 20 Hz to 20 kHz)

Physical terms

- Amplitude
- Frequency
- Spectrum

- In a free field, an ideal source of acoustical energy sends out sound of uniform intensity in all directions.
=> Sound is propagating as a spherical wave.
- Intensity of sound is inversely proportional to the square of the distance (Inverse distance law).
- 6 dB decrease of sound pressure level per doubling the distance.

What is Sound

- Ear connected to the brain
 - left brain: speech
 - right brain: music
- Ear's sensitivity to frequency is logarithmic
- Varying frequency response
- Dynamic range is about 120 dB (at 3-4 kHz)
- Frequency discrimination 2 Hz (at 1 kHz)
- Intensity change of 1 dB can be detected.

(a)

(b)

Digitization of an analog signal

(a) Sampling the original signal

(b) Recreating the signal from the sampled values

Sampling Rate

Bit Depth

Nyquist's Theorem

- *Sampling* is dictated by the Nyquist sampling theorem which states how quickly samples must be taken to ensure an accurate representation of the analog signal.

$$f_s \geq 2f$$

or

$$T_s \leq \frac{T}{2}$$

- The Nyquist sampling theorem states that the sampling frequency must be **two** times greater than the highest frequency in the original analog signal.

- AAC (Advanced Audio Coding): Apple's iPhone and iPad,
- WMA (Windows Media Audio)
- WAV (Waveform Audio File Format)
- MIDI (Musical Instrument Digital Interface)
- MP3: MPEG-1 (updated to MPEG-2), Audio Level 3 Encoding
 - Motion Picture Experts Group (MPEG), a committee of the International Organization for Standardization (ISO)
 - Sampling rate of 44,100 samples/second
 - Bit depth: 16 bits per sample.
 - High-quality sound reproduction,
 - Used format for rock, opera, and classical music

- Common Sampling Rates
 - 8KHz (Phone) or 8.012820513kHz (Phone, NeXT)
 - 11.025kHz (1/4 CD std)
 - 16kHz (G.722 std)
 - 22.05kHz (1/2 CD std)
 - 44.1kHz (CD, DAT)
 - 48kHz (DAT)
- Bits per Sample
 - 8 or 16
- Number of Channels
 - mono/stereo/quad/ etc.

Signal

Takes a function f and returns a vector whose elements are values of that function at the sample points.

Sampling in 2D takes a function and returns a matrix.

Danny Alexander

A sampling of a function that contains information about a 2D* signal.

Image stores intensity or 'brightness'

- A sampling of a function that contains information about a 2D signal.

Image stores intensity or 'brightness'

2D visible light signals are special for us

- Brightness along x and y dimensions

Image stores intensity or 'brightness'

***A Pixel Is Not A Little Square,
A Pixel Is Not A Little Square,
A Pixel Is Not A Little Square!
(And a Voxel is Not a Little Cube)¹***

Technical Memo 6

*Alvy Ray Smith
July 17, 1995*

Abstract

My purpose here is to, once and for all, rid the world of the misconception that a pixel is a little geometric square. This is not a religious issue. This is an issue that strikes right at the root of correct image (sprite) computing and the ability to correctly integrate (converge) the discrete and the continuous. The little square model is simply incorrect. It harms. It gets in the way. If you find yourself thinking that a pixel is a little square, please read this paper. I will have succeeded if you at least understand that you are using the model and why it is permissible in your case to do so (is it?).

Everything I say about little squares and pixels in the 2D case applies equally well to little cubes and voxels in 3D. The generalization is straightforward, so I won't mention it from hereon¹.

I discuss why the *little square model* continues to dominate our collective minds. I show why it is wrong in general. I show when it is appropriate to use a little square in the context of a pixel. I propose a discrete to continuous mapping—because this is where the problem arises—that always works and does not assume too much.

I presented some of this argument in Tech Memo 5 ([Smith95]) but have encountered a serious enough misuse of the little square model since I wrote that paper to make me believe a full frontal attack is necessary.

a b

FIGURE 2.17 (a) Continuous image projected onto a sensor array. (b) Result of image sampling and quantization.

Imaging sensor

Underlying analog
charge signal

Quantized
values

8 bit – 256
levels

4 bit – 16
levels

2 bit – 4
levels

1 bit – 2
levels

We often call this *bit depth*.

For photography, this is also related to *dynamic range*.

Radiometric

The amount of light in physical units, e.g.,

- Radiance -> amount of light (in Watts per unit solid angle (steradian) per square meter)
- Irradiance -> amount of light arriving at a surface over the hemisphere (in Watts per square meter)

Spectroradiometric

Radiometric but for narrow wavelength bands of light

Photometric

The perceived amount of light to an observer, e.g., a human

- Luminous intensity (candelas -> lumens per steradian)
- Illuminance (lux -> lumens per square meter)

N x M RGB image “im”

- `im[0,0,0]` = top-left pixel value in R-channel
- `im[x, y, b]` = x pixels to right, y pixels down in the bth channel
- `im[N-1, M-1, 3]` = bottom-right pixel in B-channel
